

## Drugs used in Parkinsonism

---

# To Understand better

## Parkinson's Disease

A progressive **neurodegenerative** diseases disorder that occurs mainly in the elderly and can lead to disability unless effective treatment is provided.

## Pathphysiology

This **movement** disorder occurs mainly due to **dopamine/acetylcholine imbalance** in **basal ganglia** (caudate nucleus, substantia nigra & corpus striatum) that is involved in motor control.

## Dopamine pathway

### Reward pathway

DA is manufactured in nerve cell bodies located within the **ventral tegmental area (VTA)** and is released in the **nucleus accumbens** and the **prefrontal cortex**.

### Motor pathway

cell bodies in the **substantia nigra** that manufacture and release dopamine into the **striatum**.

## In Parkinson's disease

Predominance of Ach

Deficiency of dopamine

## Parkinson's Disease

### Characters

Simplified by the acronym "**TRAP**":

- **T**remors at rest.
- **R**igidity of muscles.
- **A**kinesia or Bradykinesia (slowness in initiating and carrying out voluntary movements).
- **P**ostural and gait abnormalities.
- Anxiety or depression.

### Causes

It is **idiopathic** disease but some causes may be:

- Genetic.
- Toxins (MPTP= methyl phenyl tetrahydropyridine).
- Head trauma.
- Cerebral anoxia.
- Oxidative stress
- Drug-induced Parkinson's disease
  - e.g. **antipsychotics** like **haloperidol**.
  - **Dopamine antagonists** as **metoclopramide** (antiemetic).

# Drug Treatment

## Main approach

## Minor approach

Drugs to **increase dopaminergic** activity.

Drugs to **block cholinergic** activity

**Muscarinic antagonists**

**Increase** central DA synthesis

**Inhibition** of DA metabolism

DA receptor agonists

DA releaser: **amantadine**

**(DA precursors):**  
**L-dopa, L-dopa + Decarboxylase inhibitor.**

- **COMT inhibitors**  
(catechol-O-methyltransferase inhibitors)
- **MAO-B inhibitors**

## Take a quick look on the treatment of parkinson's disease

1

- In mild cases, **selegiline**, **amantadine** or **anticholinergics** can be used.

2

- **Levodopa** and **carbidopa** is the **main** treatment

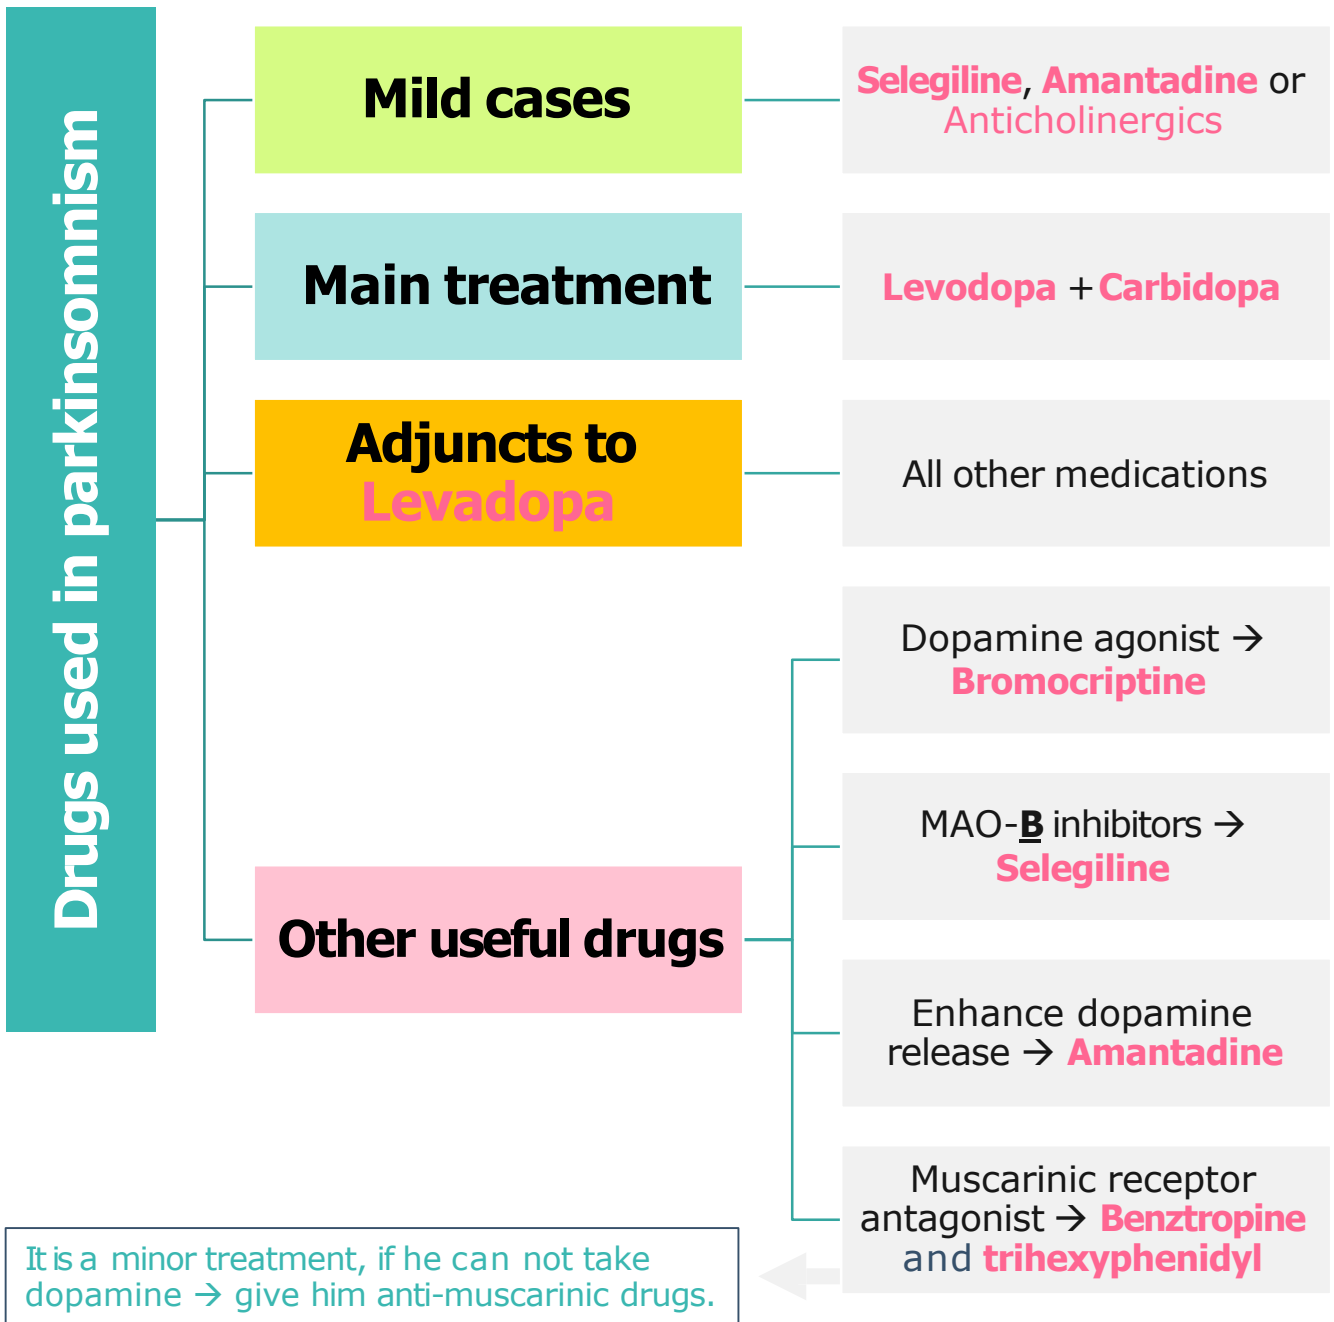

3

- All other medications are adjuncts to **levodopa** therapy

4

- Other useful drugs include :
  - **Bromocriptine** (dopamine agonist), **selegiline** (monoamine oxidase-B inhibitor),
  - **amantadine** (enhances dopamine release) and
  - **benztropine** (muscarinic receptor antagonist), that is used for parkinsonism caused by **antipsychotic drugs**.

# Mind map

## Dopamine processing in a synapse:

After release dopamine can either be → taken up again by the presynaptic terminal, or broken down by enzymes.

### Regarding the picture:

- TH:** tyrosine hydroxylase **DOPA:** L-DOPA **DAT:** dopamine transporter
- DDC:** DOPA decarboxylase **VMAT:** vesicular monoamine transporter 2
- MAO:** Monoamine oxidase **COMT:** Catechol-O-methyl transferase
- HVA:** Homovanillic acid

# Drugs that increase dopaminergic activities (DA precursors)

## Levodopa (L-dopa)

Pharmacokinetic

a body shamer say's:  
leave dopa = لا اوكرنا  
\*Body shaming: the act of discriminating against other body types.

- It is a precursor of dopamine.
- Is converted into dopamine via **dopa decarboxylase** (DC) peripherally and centrally. → [Pathway of L-dopa](#)
- Dopamine formed peripherally is metabolized by **MAO** (monoamine oxidase) & **COMT** (catechol-o-methyl transferase) enzymes).
- 99% L-dopa is **decarboxylated** to give dopamine in gut and liver by **decarboxylase** enzyme.
- **1%** crosses **BBB** to form dopamine centrally.
- Given **orally** (should be taken on **empty stomach** –especially proteins-).
- Absorbed from the **small intestine** and taken up to CNS by **active transport system**. → so if we take a protein meal → uptake process done by competition process between the amino acids & L-dopa.
- **Short** duration of action ( $t_{1/2} = 2 \text{ hs}$ ) → (fluctuation of plasma concentration).

Limitation

### Limitation of L-DOPA treatment:

- **Dyskinesia** (involuntary movements occurs in 40 to 90% of patients) → due to **fluctuating plasma levels of levodopa**. (صقبو هوي بنت رخ هويوت يعني.)
- The dyskinesia can be reduced by **lowering the dosage**; however, the symptoms of parkinsonism may then reappear.
- **Wearing-off effect** (duration of "on" states becomes shorter) → في نكل نولاً نا اهانعم ل لب اود لا ا فح
- **On-off phenomenon** (On= improved mobility & Off=Akinesia or hypomobility) → bc of short  $T_{1/2}$

Why? → <b>L-dopa</b> is a precursor of <b>melanin</b> → so it may activate malignant melanoma.</li> </ul>	

Click on the pic

# Dopamine receptor agonists

## Overview

- Have **longer** duration of action than **L-dopa** (less likely to cause **dyskinesias** than **levodopa**)  Dyskinesia 3:01 min

## Clinical use

- As monotherapy**, the dopamine agonists are **less effective** than **levodopa**. Thus can only be used as initial therapy for **early** stages of the disease.
- In advanced stages**, dopamine agonists are used as an **adjunct** to **levodopa**, they may contribute to clinical improvement and reduce **levodopa** dosage needs.
- Lippincott: Dopamine agonists may delay the need to use **levodopa** therapy in early Parkinson disease and may decrease the dose of **levodopa** in advanced Parkinson disease.

### Ergot derivatives:

Bromocriptine, pergolide

### Non ergot derivatives:

Pramipexole

## Bromocriptine

- D<sub>2</sub>** agonist
- Is given orally
- $T_{1/2} = 6-8$  h. Longer than **Levodopa** ( $t_{1/2} = 2$  h)
- Used for the **treatment** of:
  - Parkinson's disease
  - Hyperprolactinemia (**galactorrhea**): a condition of elevated serum prolactin «**إفلا نومر**», which induces infertility in women. Secretion of prolactin is under **inhibitory** control by dopamine. → امك نيلودا بوتسم لق تكلورا داز.
- 3. Infertility in women.**

## Pramipexole

- D<sub>3</sub>** agonist
  - Used alone as **initial therapy** or in combination with **L-dopa**.
  - Is given **orally**, excreted unchanged in urine.
  - Has the advantage of being **free radicals scavenger**.
- For example, **cimetidine**, which inhibits renal tubular secretion of organic bases, increases the half-life of **pramipexole** by 40%.

Ergot refers to a group of fungi of the genus *Claviceps*. This fungus grows on rye and

# Dopamine receptor agonists (cont.)

## Adverse effects

Similar to **L-dopa**:

- Nausea, vomiting, postural hypotension
- Cardiac arrhythmias
- **Confusion, hallucinations, delusions**
- Dyskinesias (less prominent).

## Contraindications

- **Psychosis**
- Peripheral vascular disease (**only ergot derivatives**, which cause severe **vasoconstriction** and may cause **gangrene** with high dosage)
- Recent **myocardial infarction**.

**Figure 8.11**  
Some adverse effects of dopamine agonists.

The actions of *bromocriptine* are similar to those of *levodopa*, except that hallucinations, confusion, delirium, nausea, and orthostatic hypotension **are more common**, whereas **dyskinesia is less prominent**. In **psychiatric illness**, *bromocriptine* and *levodopa* may cause the mental condition to worsen. **Serious cardiac problems** may develop, particularly in patients with a history of **myocardial infarction**. In patients **with peripheral vascular disease**, a worsening of the vasospasm occurs, and in patients with **peptic ulcer**, there is a worsening of the ulcer. Unlike the ergotamine derivatives, *pramipexole* and *ropinirole* **do not exacerbate peripheral vasospasm**, and they do not cause fibrosis. Nausea, hallucinations, insomnia, dizziness, constipation, and orthostatic hypotension are among the more distressing side effects of these drugs, **but dyskinesias are less frequent than with levodopa**.

- Lippincott, page 106

**Figure 8.12**  
Motor complications in patients treated with *levodopa* or dopamine agonists.

# Amantadine

## Characteristics

- originally introduced as an **antiviral**.

### Action:

- Increases dopamine release.** → Also decrease the reuptake of DA.
- Acts as an **antagonist at muscarinic receptors**
- Antagonist at NMDA** receptors (N-methyl-D-aspartate) (glutamate receptors)

### Administration:

- given **orally** with short half life.

### Excretion:

- most of the drug is excreted unchanged in the **urine**

### Efficacy:

- Less** efficacious than **L-dopa**
- Tolerance** develops to its therapeutic effect after **6-8** months. (tolerance is after 3-5 years for **levodopa**)
- Its benefits last only for **short period** and only used for **L-dopa resistance** (which is caused by variation in response among patients)
- Amantadine** and the **anticholinergics** may exert **additive effects on mental functioning**. (A **muscarinic receptor antagonist** effect)
- Useful in the **early stages** of parkinsonism or as an **adjunct to levodopa therapy**.

## Adverse effects

- Nausea, anxiety, insomnia, confusion, hallucinations (**dopamine like side effects**).
- Dry mouth, urinary retention (**anticholinergic effects**).
- Restlessness and **hallucinations (NMDA antagonist)**. → NMDA is a type of glutamate receptors & glutamate is an excitatory neurotransmitter, antagonizing it will thus cause restlessness and hallucinations.
- Ankle edema**, and livedo reticularis.

It was accidentally discovered that the antiviral drug *amantadine* [a-MAN-ta-deen], which is effective in the treatment of influenza has an antiparkinsonism action. *Amantadine* has several effects on a number of neurotransmitters implicated in causing parkinsonism, including **increasing the release of dopamine, blocking cholinergic receptors, and inhibiting the N-methyl-D-aspartate (NMDA)** type of glutamate receptors. The drug may cause restlessness, agitation, confusion, and hallucinations, and, at high doses, it may induce acute toxic psychosis. Orthostatic hypotension, urinary retention, peripheral edema, and dry mouth also may occur. *Amantadine* is less efficacious than *levodopa*, and tolerance develops more readily. However, *amantadine* has fewer side effects. The drug has little effect on tremor, but it is more effective than the anticholinergics against rigidity and bradykinesia.

# Monoamine oxidase-B (MAO-B) inhibitors

Dru g	<b>Selegiline</b>	
Mech. of action	<ul style="list-style-type: none"> <li>- It is a <b>selective irreversible inhibitor of MAO-B</b>, an important enzyme for <b>dopamine metabolism</b>. * MAO-A → metabolize <b>NE, 5-HT, DA</b></li> <li>- The blockade of dopamine metabolism makes <b>more</b> dopamine available for stimulation of its receptors.</li> </ul>	
P.K	<p>Metabolized to <b>desmethylselegiline</b>, which is <b>anti-apoptotic</b>.</p> <ul style="list-style-type: none"> <li>- <b>Selegiline</b> may have <b>neuroprotective effect</b>.</li> <li>- Has <b>anti-oxidant activity</b> against toxic <b>free radicals</b> produced during dopamine metabolism.</li> </ul>	
Indication	<p>Adjunctive to <b>levodopa/carbidopa</b> in <b>later-stage</b> parkinsonism to:</p> <ul style="list-style-type: none"> <li>- Reduce the required dose of <b>levodopa</b></li> <li>- <u>Delay</u> the onset of <b>dyskinesia</b> and motor fluctuations that usually accompany long-term treatment with <b>levodopa</b>.</li> </ul>	
ADRs	<p>At high doses:</p> <ul style="list-style-type: none"> <li>- It may <b>inhibit MAO-A</b> → (<b>hypertensive crises</b>) → as a result, do not prescribe <b>selegiline w\ drugs that increase the level of catecholamines</b>.</li> <li>- May cause <b>insomnia</b> when taking later during the day.</li> </ul>	
C.I	<p>Should NOT be co-administered with:</p> <ul style="list-style-type: none"> <li>- <b>Trypticlic Antidepressants</b></li> <li>- <b>Selective serotonin reuptake inhibitors</b> (this causes <b>hyperpyrexia</b>, agitation, delirium, coma.) → <b>Serotonin toxicity</b>.</li> <li>- Food restriction "<b>low tyramine diet</b>" is required. → increase release of E &amp; NE → <b>sever elevation in BP (cheese effect)</b></li> </ul>	

## COMT Inhibitors

(Catechol-O-methyl transferase) Inhibitors

Dru g	<b>Entacapone</b>	<b>Tolecapone</b>
MOA	<ul style="list-style-type: none"> <li>- Acts <b>peripherally</b> to inhibit COMT enzyme required for <b>L-dopa</b> degradation.</li> <li>- Usually given <b>in combination</b> with <b>L-dopa</b> and <b>carbidopa</b> to diminishes <u>peripheral</u> metabolism of L-dopa.</li> </ul>	<ul style="list-style-type: none"> <li>- <b>Peripheral</b> and <b>central</b> COMT inhibitor → More <b>lipid soluble</b> than <b>entacapone</b>.</li> <li>- More penetration into CNS.</li> <li>- <b>Tole</b> = <u>Total</u> = Central &amp; peripheral</li> </ul>
Indications	<p>Used as adjuvant to <b>L-dopa</b> + <b>carbidopa</b> to:</p> <ul style="list-style-type: none"> <li>- Decrease fluctuations</li> <li>- Improve response</li> <li>- Prolonged the <b>ON-Time</b> → رڤا نغو سلاج نيطولا نلا ضرهلا تلاح نسحي</li> </ul>	
ADRs	<ul style="list-style-type: none"> <li>- <b>L-dopa</b> side effects. - <b>Orange</b> discoloration of urine.</li> </ul>	

# Anticholinergic Drugs

Drug	Benztropine	Trihexphenidyl
MOA	<ul style="list-style-type: none"> <li>- <b>Central muscarinic antagonist.</b></li> <li>- It has <b>modest</b> anti-parkinsonian action.</li> </ul>	
Indications	<ul style="list-style-type: none"> <li>- <b>Improve tremor &amp; rigidity.</b> (but have little effect on <b>bradykinesia</b>.)</li> <li>- Provide benefit in <b>drug-induced parkinsonism</b> (due to <b>antipsychotics</b>).</li> <li>- Used during <b>early</b> stage of the disease</li> <li>- Used as an <b>adjunct</b> to <b>levodopa</b> therapy.</li> </ul>	
ADRs	<ul style="list-style-type: none"> <li>- Cycloplegia</li> <li>- Mydriasis</li> <li>- Dry mouth</li> <li>- Urinary retention</li> <li>- <b>Constipation</b></li> </ul> <ul style="list-style-type: none"> <li>- <b>At high doses:</b> <ul style="list-style-type: none"> <li>- Confusion</li> <li>- Delirium</li> <li>- Hallucinations</li> </ul> </li> </ul>	
C.I	<ul style="list-style-type: none"> <li>- Prostatic hypertrophy</li> <li>- Glaucoma</li> <li>- <b>Intestinal obstruction.</b></li> </ul>

# Summary-2

## Dopamine receptor agonists

Drug	Ergot derivatives: <b>pergolide</b> , <b>Bromocriptine</b>	Non ergot derivatives: <b>Pramipexole</b>
P. D	- <b>D<sub>2</sub></b> agonist.	- <b>D<sub>3</sub></b> agonist.
P. K	- Longer T <sub>1/2</sub> than <b>levodopa</b> .	- Given orally.
Indications	- Parkinson's disease. - Hyperprolactinemia (galactorrhea) - Infertility in women.	- Used alone as <b>initial therapy</b> or in combination with <b>L-dopa</b> . - Has the advantage of being free radicals scavenger.
	- <b>As monotherapy</b> , the dopamine agonists are <b>less effective</b> than <b>levodopa</b> . - <b>In advanced stages</b> , dopamine agonists are used as an <b>adjunct to levodopa</b> , they may contribute to clinical improvement and reduce <b>levodopa</b> dosage needs.	
ADRs	- Similar to <b>L-dopa</b> : - Nausea, vomiting, postural hypotension. - Confusion, hallucinations, delusions.	- Cardiac arrhythmias - Dyskinesias (less prominent).
C.I	Psychosis, Peripheral vascular disease (for ergot derivatives only), Recent <b>myocardial infraction</b> .	

Drug	<b>Amantidine</b> (Antiviral)	
P. D	- ↑ <b>Dopamine release</b> . - Antagonist at <b>muscarinic</b> receptors. - Antagonist at <b>NMDA Rs</b> . - <b>Efficacy</b> : Less efficacious than <b>L-dopa</b> , Tolerance after 6-8 months & <b>Amantidine</b> and the <b>anticholinergics</b> may exert <b>additive effects on mental functioning</b> .	
P.K	Orally, short T <sub>1/2</sub> , excreted unchanged in the urine.	
Indications	- Its benefits last only for <b>short period</b> and <u>only</u> used for <b>L-dopa resistance</b> .	
ADRs	- Nausea, anxiety, insomnia, confusion, hallucinations ( <b>dopamine like side effects</b> ). - Dry mouth, urinary retention ( <b>anticholinergic effects</b> ). - Restlessness and hallucinations ( <b>NMDA antagonist</b> ).	

Drug	<b>Selegiline</b>	
P. D	- <b>selective irreversible inhibitor of MAO-B</b> . → imp for dopamine metabolism. → more dopamine available. - Has anti-oxidant activity against toxic free radicals produced during dopamine metabolism.	
P.K	- Metabolized to <b>desmethylselegiline</b> , which is <b>anti-apoptotic</b> .	
Indications	Adjunctive to <b>levodopa/carbidopa</b> in later-stage parkinsonism to: - Reduce the required dose of <b>levodopa</b> - Delay the onset of dyskinesia and motor fluctuations that usually accompany long-term treatment with <b>levodopa</b> .	
ADRs	At high doses: - May inhibit <b>MAO-A</b> → (hypertensive crises) - May cause <b>insomnia</b> when taking later during the day.	C.I - Should <b>NOT</b> be co-administered with <b>Tricyclic Antidepressants</b> or <b>selective serotonin reuptake inhibitors</b> or Food restriction "low <b>tyramine</b> diet" is required.

# Summary-3

COMT inhibitors		Anti-cholinergic
Drug	<b>Entacapone &amp; Tolcapone</b>	<b>Benzotropine &amp; Trihexphenidyl</b>
P.D	<ul style="list-style-type: none"> <li>- Act <u>peripherally</u> → Both</li> <li>- Acts Centrally → Tolcapone</li> <li>- Inhibit <b>COMT</b> enzyme which is required for <b>L-dopa</b> degradation.</li> <li>- Diminishes peripheral metabolism of <b>L-dopa</b>.</li> </ul>	<ul style="list-style-type: none"> <li>- Central muscarinic antagonist.</li> <li>- It has modest anti-parkinsonian action.</li> </ul>
Indications	Used as adjuvant to <b>L-dopa</b> to: <ul style="list-style-type: none"> <li>- Decrease fluctuations</li> <li>- Improve response</li> <li>- Prolonged the <b>ON-Time</b></li> </ul>	<ul style="list-style-type: none"> <li>- <b>Improve tremor &amp; rigidity</b>.
